

During the event I could get in contact with researchers from other countries and different institutions. I also got in contact with different methods of analysis (many of them related to my object of study), and had the opportunity to approach other areas of knowledge within Geomorphology.

In my opinion, the wide variety of topics was the keynote of the event. Knowing that there are several possibilities to follow, many of them close to the reality of my country, gave me a perspective that I am on the right path, and that it is indeed possible to achieve great results. This was the greatest contribution that I could experience during that period.

Furthermore, I am grateful and hopeful. Firstly for winning and being part of the Young Geomorphologist Award, and secondly, for the opportunity given to young researchers, stimulating and increasing their participation in events of this magnitude. My experience during the event will be shared with other Brazilian researchers.

Paris was very warm and gave me a cultural perspective beyond my imagination. The choice of the city and the venue brought me a perfect combination between stimulus and encouragement to keep working in my field of research.

It is my intention to cultivate simplicity, self-criticism, and to disseminate ideas and discussions for the improvement of the geomorphological science, regardless the area of expertise.

Finally, I would like to thank the entire committee for the effort put into providing us such a warm and rewarding event.

Thank you!

See you again at the next event.
