I was fortunate to receive a scholarship from the International Association of Geomorphologists (IAG) grant to attend the 9th Argentine Congress on Quaternary and Geomorphology, held from August 25 to 28, 2026, in Diamante, Entre Ríos Province, Argentina. This opportunity provided me with valuable experience for academic exchange and professional growth within the regional geomorphological community.

The grant provided by the IAG allowed me to present the poster “Geomorphological Indicators of Deep Chemical Weathering in Chinle Formation Sandstones, Petrified Forest National Park, Arizona, USA” and share the results with geomorphologists from across the region. During the poster session, I received very positive feedback on my research, as well as constructive suggestions that will be useful for future scientific studies. In addition, the conference introduced me to updated methodologies and innovative approaches in Quaternary and geomorphological research, broadening my understanding of the tools and techniques currently being applied in these fields.

This experience helped strengthen existing collaborations with research groups and institutions outside my country, while also creating new professional connections with strong potential for future cooperation through formal institutional collaborations. Furthermore, my participation increased the visibility of my research within the scientific community, allowing me to share the results of ongoing studies in Paraguay and exchange experiences with professionals from different areas.
